

MANIPAL HACKATHON — 2025 —

CODE FOR COEXISTENCE

Powered by  **cognecto**

ROUND 2

TECHNICAL RULEBOOK

OVERVIEW

- 1.** Development Guidelines
- 2.** Github Workflow
- 3.** Data Usage
- 4.** Bug Bounty Round
- 5.** Final Presentation Round
- 6.** Contact Us

DEVELOPMENT GUIDELINES

- 1. Original Work:** All code must be developed during the hackathon. Pre-written code is not permitted.
- 2. Referencing External Code:** Proper citations must be provided for any referenced code. **Code similarity checks will be carried out to ensure compliance.**
- 3.** Teams are advised to set up emulators on their systems before the commencement of the hackathon.

GITHUB WORKFLOW

1. Initial Setup:

- At the beginning of the hackathon, each team will be provided with its own repository. This repository will include a 'README' file template and the rulebook. Teams must use this repository for their project.
- The repo's README should either contain **Docker setup instructions** (with docker-compose.yml and Dockerfiles) or **full manual setup** and installation instructions.

GITHUB WORKFLOW

2. Branching Strategy:

- Teams should create a branch named main for development.
- Sub-branches can be created within the main branch to manage independent workflows.

3. Commit and Push Protocol:

- Regular commits are required to show continuous progress.
- Teams must push updates to the remote repository at least once every hour.

DATA USAGE

- Teams are encouraged to use publicly available datasets from platforms like data.gov.in or Kaggle.
- Generating your own dataset in sensitive areas such as healthcare (e.g. EMG, EEG), is strictly prohibited and will result in appropriate actions being taken.

BUG BOUNTY ROUND

The **Bug Bounty Round** will take place **after 28 hours of coding**. By this time, all teams are expected to have a **complete and functional project**. In this round, teams will **test each other's projects for bugs**, with the results directly impacting the overall score. The process introduces a competitive element focused on **code quality and stability**. Entering this round may give the teams upto 30% advantage in the overall score.

- The **team finding bugs** will be called **Evaluators**.
- The **team whose project is tested** will be called **Evaluatees**.

BUG BOUNTY ROUND

1. Prerequisites

1.1 GitHub Requirements

- a. Teams must have basic **GitHub knowledge**.
- b. The organizing committee will **create a separate Bug Bounty repository** for each team.
- c. Teams must **push their test-ready code** to this repository **before the Bug Bounty Round begins**.
- d. Once the round starts:
 - a. **All write access will be removed** from the Bug Bounty repositories.
 - b. Repositories will be **shared with other teams in read-only mode** for testing and bug reporting.

BUG BOUNTY ROUND

- e. Teams will have **no ability to push or modify** their Bug Bounty repository after the round begins. Any attempt to bypass this will result in **disqualification**.

After the Bug Bounty Round, teams must

- f. **continue all further work only in the main branch** of their original development repository.

1.2 Deployment & Setup

- a. Web-based solutions must be deployed online/local on LAN. If online deployment is not possible.
- b. Mobile-based solutions should provide APK.

BUG BOUNTY ROUND

c. Teams must provide either a complete Docker setup (including docker-compose.yml, necessary Dockerfiles, and clear usage instructions in the README) or full setup and installation instructions in the README detailing all dependencies, configurations, and commands required to run the project without Docker.

A **clear and complete README** is mandatory,

d. including all **setup and installation steps**.

If 1.2.c is not met, the team is disqualified from the bug bounty round.

If either 1.2.a or 1.2.b is not met, points will be deducted.

BUG BOUNTY ROUND

1.3 Evaluation Environment

- a.** All teams will be on the same network to allow local hosting.
- b.** Teams are not required to give admin access to evaluators.
- c.** Any false claims will be penalized.

2. Testing Procedure

- Teams will be **randomly grouped**.
- Each group will **test each other's projects for 2 hours**.
- Evaluators will record and submit bugs found.

BUG BOUNTY ROUND

3. Repository Access

- During this round, push access will be disabled for all repositories.
- No direct changes are allowed to codebases.

4. Scoring System:

- This round will have its **own point system** where a maximum of 100 points can be earned or lost. This will influence the team's **cumulative score** (until this round) by **±30%**; scores outside this range will be normalized.

BUG BOUNTY ROUND

- Evaluator will **gain** points for **valid** bug reports and Evaluatee will **lose** points for having bugs in their own projects.
- Teams have an option to withdraw from this round, by **informing the organizers in advance** if their project does not meet the above requirements, resulting in 30% deduction.
- Teams which enter the bug bounty round but fail to meet requirements without prior notice, resulting in **40% deduction** and **disqualification from this round**.

BUG BOUNTY ROUND

5. Example:

- A team earns 80 points overall and scores 50 points in the bug bounty round. After this round, their final score will be 92. Here's how: 50% of 30% equals 15%, and 15% of 80 is 12. Thus, the final score is **$80 + 12 = 92$** .
- Similarly, if a team earns 80 points overall and scores -50 points in the bug bounty round. After this round, their final score will be 68. Here's how: 50% of 30% equals 15%, and 15% of 80 is 12. Thus, the final score is **$80 - 12 = 68$** .

FINAL PRESENTATION ROUND

In the Presentation round, the top **10** teams will showcase their projects to all judges and participants.

- This round will be judged by a panel of judges.
- **Time Limit:** Each team will have a maximum of **6 minutes** to present their Project, followed by a **2 minutes** Q&A session.
- This will be followed by the Final Evaluation Round.
